Full-selection diagnostic: 12 layers + alpha + fixed near-tie rule
Same-sex label shuffling destroys age associations; these are descriptive distributions, not p-values.
BMI
99 random-label selections
Observed gain = 0.241
Largest random gain = 0.106
Number of permutations
MAE(age + sex) − MAE(selected SSL + age + sex) (kg/m²)
Height
99 random-label selections
Observed gain = 0.604
Largest random gain = 0.563
Number of permutations
MAE(age + sex) − MAE(selected SSL + age + sex) (cm)
